COMP 130 – Introduction to Programming (Java)

Name & Surname

This program should ask the user for name and surname pairs and check and fix their format according to the following rules:

a) The name-surname string entered by the user should consist of two words with a single space in between. If this is not the case, the program should indicate an error and exit.

b) The program should then check and fix the capitalization: The first letters of the name and surname should be converted to uppercase, and the rest of the letters should be converted to lowercase.

c) The corrected string should be printed out and the program should ask for the next name-surname pair.

Sample Run:

```
Enter name and surname: name surname
Name Surname
Enter name and surname: NAME SURNAME
Name Surname
Enter name and surname: NAMESURNAME
Not a valid format
```
